benefits of a SMART central vacuum system

up to five times more powerful than uprights

SMART central vacuum systems carry dirt and debris away from living areas...and can be installed in your new or existing home — with no mess, no disturbance to your walls — usually in less than a day.

how a SMART system carries dirt and debris out of living areas...

- PVC piping installed through interior walls, attic, basement and crawlspaces connects vacuum inlets to the power unit/dirt collection receptacle (usually located in a basement and garage).
- each strategically located inlet lets you vacuum approximately 20-40 square meters.
- a SMART system can be installed in virtually any home, new or old, usually in just hours.

easy whole-house cleaning

why lug a heavy vacuum? a SMART system has a flexible hose, durable lightweight tools, and versatile cleaning attachments that let you reach everywhere you want to clean...floors, furniture, walls, blinds, even ceiling fans...with ease.

allergy sufferers breathe easier

the U.S. Environmental Protection Agency says indoor air is five times worse than outdoor air...and that six out of 10 homes and buildings are "sick" and are hazardous to their occupants. that's why millions of asthma and asthma sufferers are so miserable even in their own homes! a SMART central vacuum system can help improve indoor air quality...as much as 52%! dirt, dust, dander, pollen, mold, spores, and other allergens are picked up and carried to a sealed SMART dirt receptacle (usually located away from living areas)...so your living environment stays cleaner and dust-free longer.

easy installation in new and existing homes

a SMART central vacuum system is not only healthier, it's quieter... and can be installed in your new or existing home, usually in a few hours. an authorized SMART distributor can do the job, or you can do it yourself.

This is how easy a central vacuum system works.
